

USDA/National Agricultural Statistics Service Geospatial Programs

Research & Development Div.
Geospatial Information Branch - Spatial Analysis Research Section (SARS)
Fairfax, VA., USA

Larry Beard – Senior Agricultural Statistician
larry_beard@nass.usda.gov

The NASS Mission

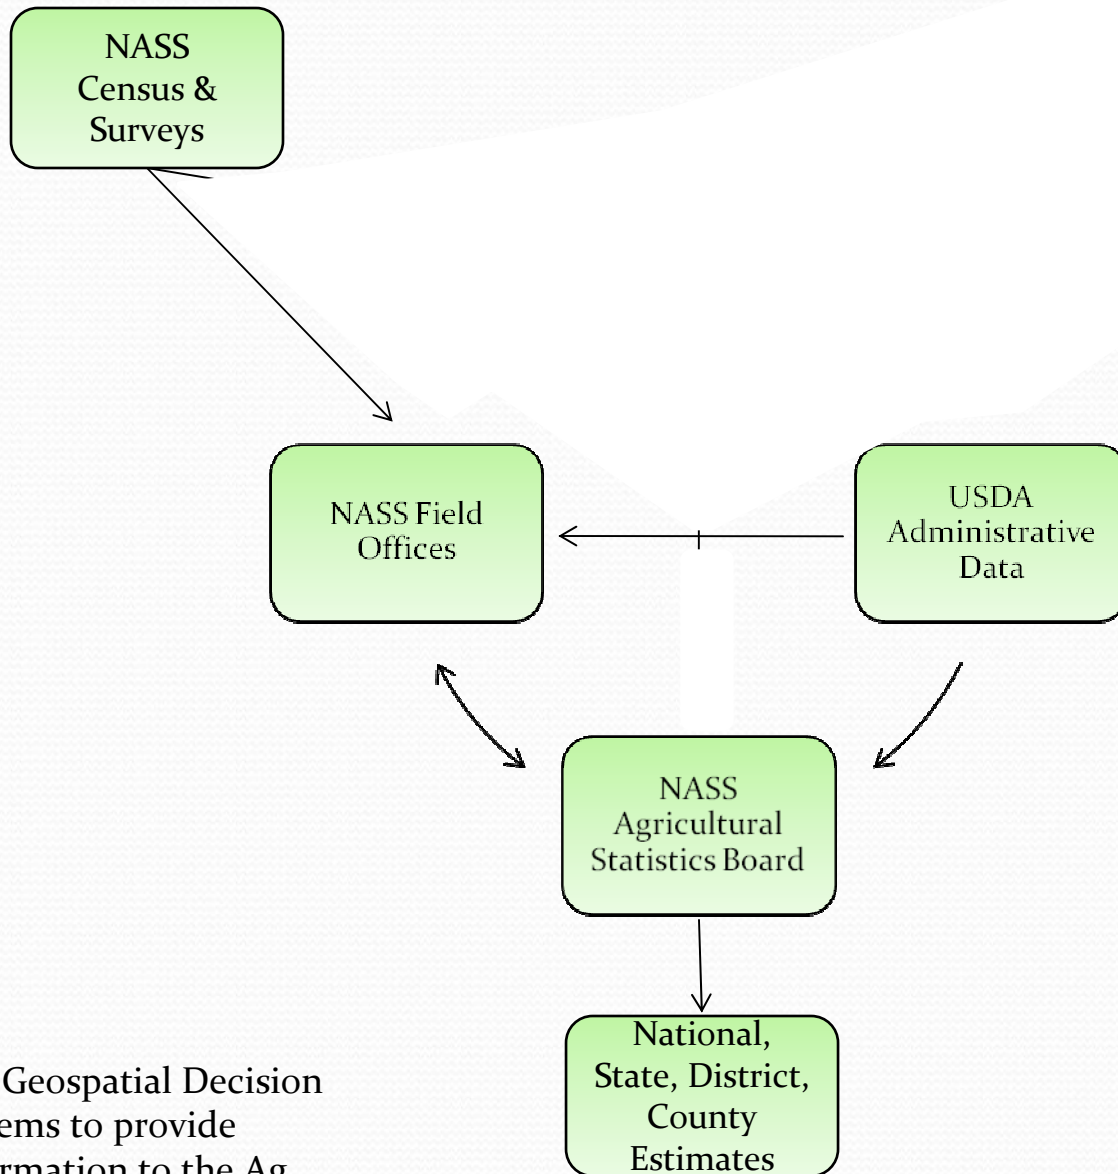

“To provide timely, accurate, and useful statistics in service to U.S. agriculture”

- U.S. statistical system is decentralized.
- The Food & Fiber Sector is largest single component of US GDP.
- NASS is the official data collection (& dissemination) arm of USDA, providing the Official Statistics of and about US Agriculture.
- Most data series mandated by law.
- Crop monitoring & assessment is mandated, but NASS works closely with the public and agriculture sector to determine report content & scheduling.
- We're a public information service, we don't do much in the way of analyses, interpretation, or predictions.
- Literally billions of \$\$\$ and millions of decisions are made based on NASS reports every year, a heavy responsibility to “get it right”.
- NASS is unique in that we are a federal, operational program, with a statistical research component, mandated by law.

My point – NASS acreage & crop reports are serious business, and the acceptance of remote sensing-based crop monitoring & assessments by the Agency is a major

NASS Estimation Systems

* NASS Uses Geospatial Decision Support Systems to provide updated information to the Ag Statistics Board and data users

Cropland Data Layer (CDL) Objectives

- “Census by Satellite”
 - *Annually* cover major program crops and regions
 - Crops accurately geo-located
- Deliver in-season remote sensing acreage estimates
 - NASS Official Reports
 - Update planted area
 - Reduce respondent burden from surveys
- Provide timely, accurate, useful estimates
 - Measurable error
 - Unbiased/independent estimator
 - State, District, County
- Public domain crop specific crop classification
 - Hosted @ [NRCS Geospatial Data Gateway](http://www.nrcs.usda.gov/geospatial_data_gateway/) or <http://www.nass.usda.gov/research/Cropland/SARS1a.htm> or
 - Google “Cropland Data Layer”

2010 CDL States
June Ag Survey 6/14

14 states – winter wheat

2010 CDL States
August Production 8/2

14 – corn & soybeans

2010 CDL States
September Production 9/1

15 – rice, cotton & peanuts

2010 CDL States
September Small Grain Summary 9/20

17 – all small grains

2010 CDL States
October Production 10/1

24 – all crops

2010 CDL States
Operational

27 – operational

Ground Truth – Land Cover

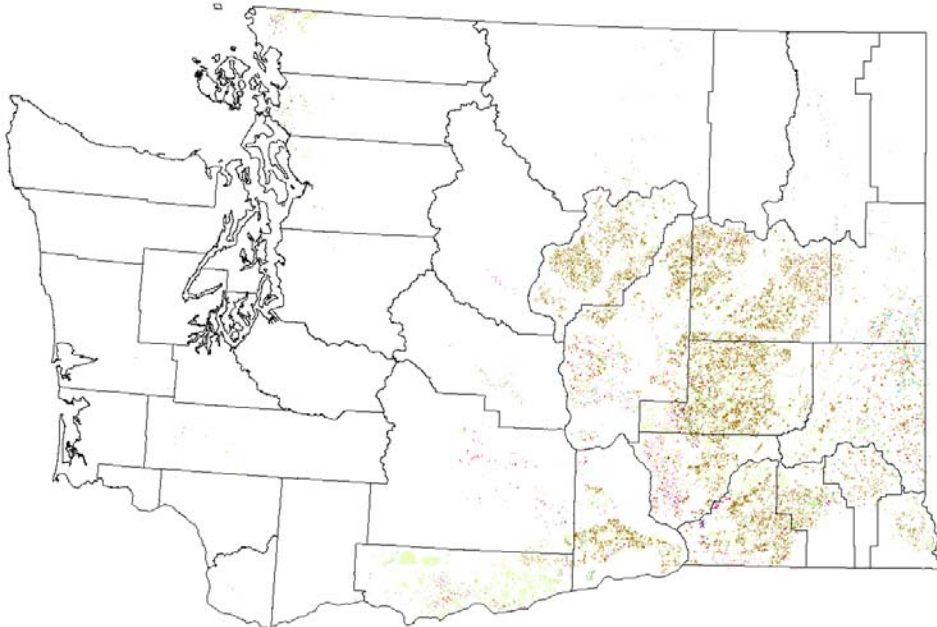

Agriculture Ground Truth

Provided by Farm Service Agency
Identifies known fields and crops

Divide known fields into 2 sets

½ used for training software

½ used for validating results

Non-Agriculture Ground Truth

USGS National Land Cover Dataset

Identifies urban infrastructure and
non-agriculture land cover

Forest, grass, water, cities

Ground Truth – Ancillary US Geological Survey

Forest Canopy

Elevation

Impervious Surfaces

Ancillary datasets help separate the agricultural landscape; determining agricultural potential

Validating CDLs

We measure the accuracy of each CDL

Compare:

Classified pixels from CDL

Known pixels, not used for classifying imagery, from FSA

Track:

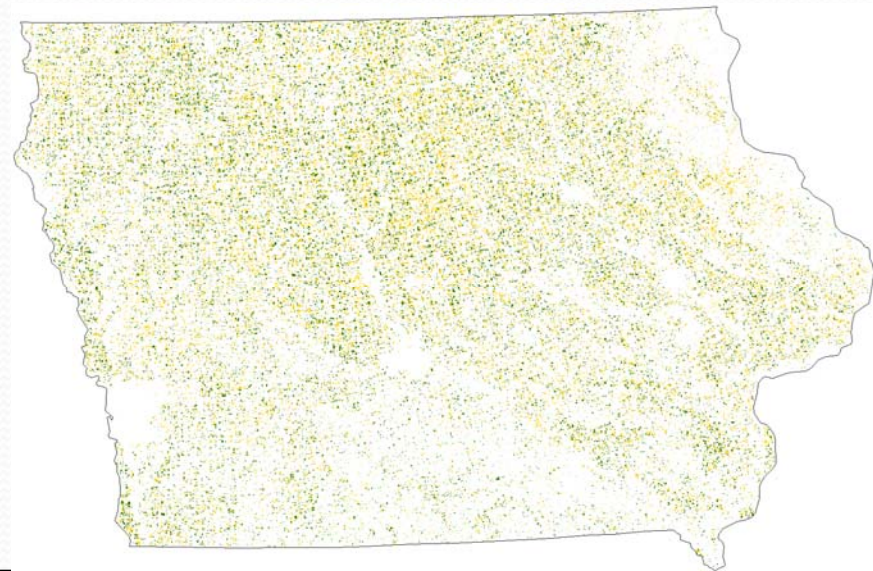

Producer Accuracy - Errors of Omission - % of pixels from category missing

User Accuracy - Errors of Commission - % of pixels from category that are over classified

Cropland Data Layer

Groundtruth – ½ saved for validation

versus

| SD | OVERALL ACCURACY | 2306428 | 87.51% | 12.49% | 0.8416 |

State level accuracies are very high

Producer's Accuracy: relates to the probability that a ground truth pixel will be correctly mapped and measures errors of omission.

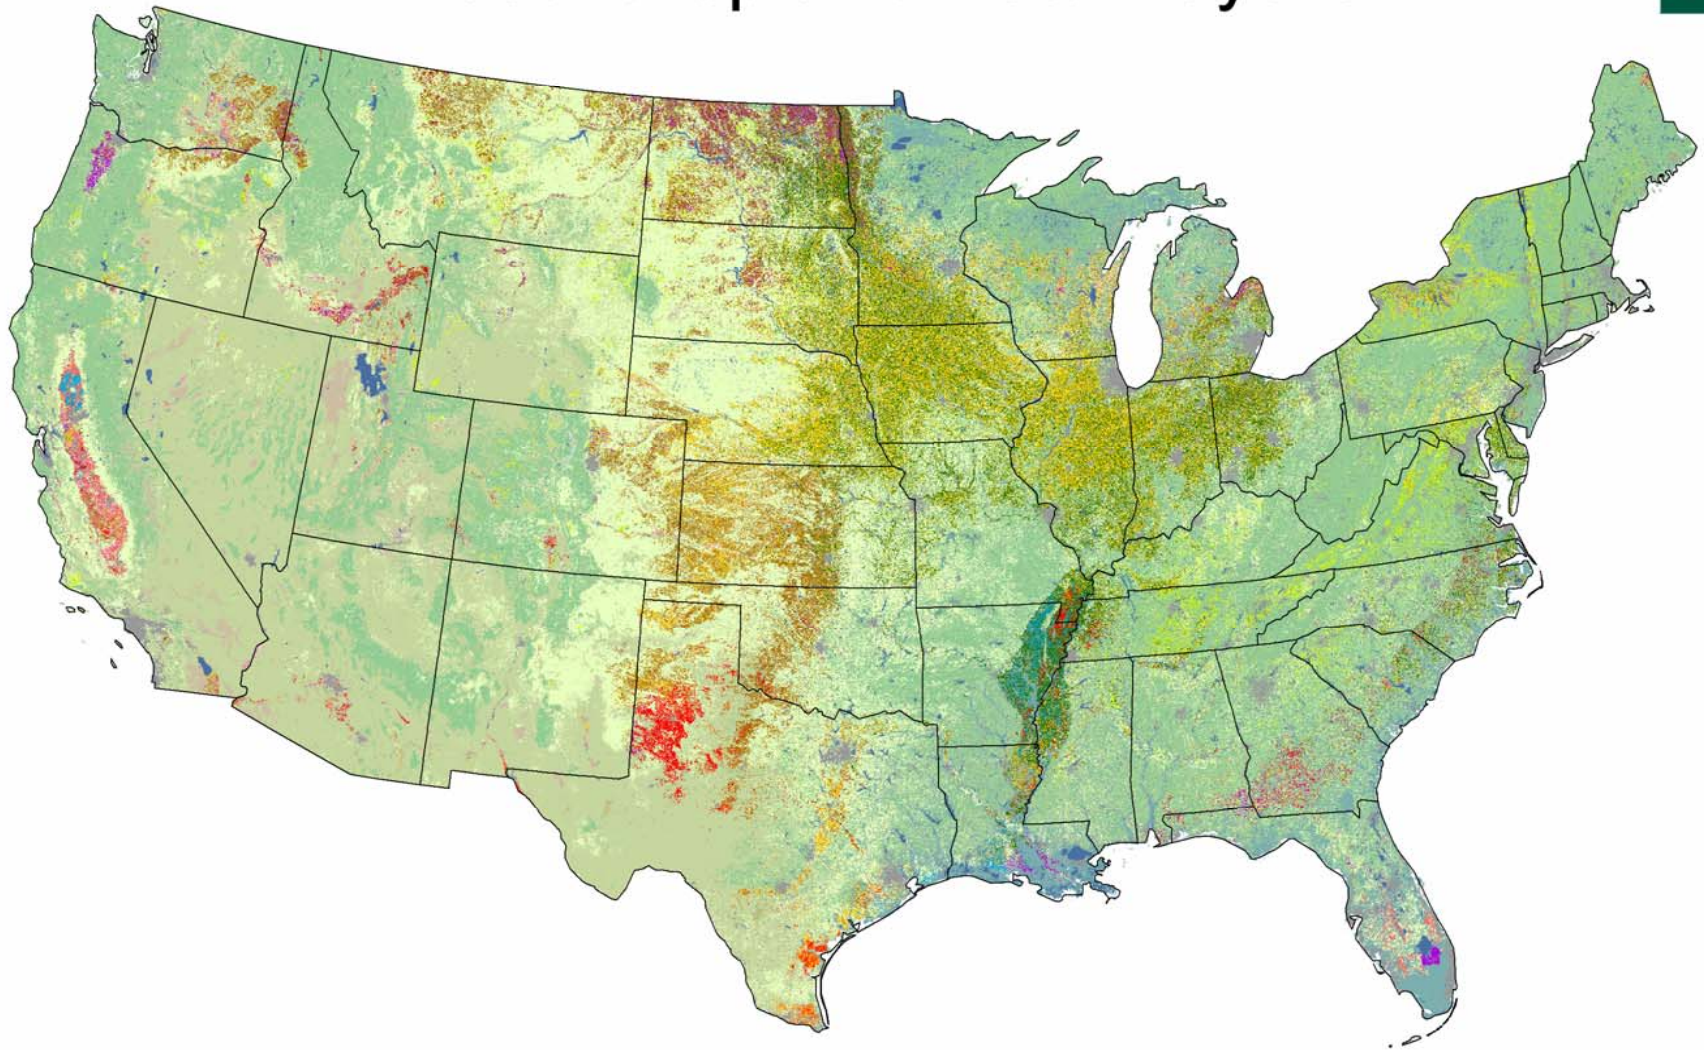

Errors of Omission: occur when a pixel is excluded from the correct category.

User's Accuracy: indicates the probability that a pixel from the classification actually matches the ground truth data and measures errors of commission.

Errors of Commission: occur when a pixel is included in an incorrect category.

Kappa Coefficient: A statistics measure of agreement, beyond chance, between two maps.

2009 Cropland Data Layers

Land Cover Categories (by decreasing acreage)

Agriculture

- | | |
|---------------|----------------------|
| Pasture/Grass | Fallow/Idle Cropland |
| Corn | Alfalfa |
| Soybeans | Cotton |
| All Wheat | Other Crops |
| Other Hays | Sorghum |

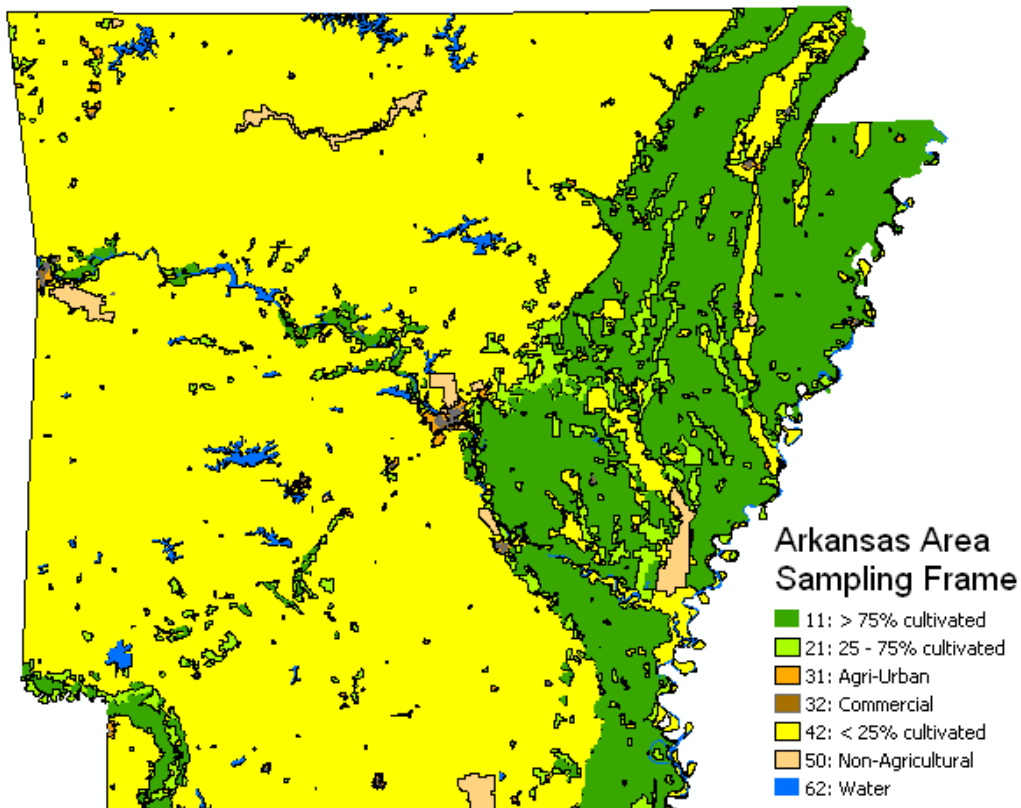

- | |
|------------------------|
| Vegetables/Fruits/Nuts |
| Other Small Grains |
| Rice |

Non-Agriculture

- | | |

| Woodland | Barren |
| Shrubland | Perennial Ice/Snow |
| Urban/Developed | |
| Wetlands | |
| Water | |

Remote Sensing Regression Estimation

PAGE 2

SECTION D - CROPS AND LAND USE ON TRACT

17

How many acres are inside this blue tract boundary drawn on the photo (map)?

Now I would like to ask about each field inside this blue tract boundary and its use during 2000

| FIELD NUMBER | | 01 | 02 | |
|--------------|---|----------------------------------|-----|-----|
| 1. | Total acres in field | 828 | 828 | 828 |
| 2. | Crop or land use. [Specify] | | | |
| 3. | Occupied farmstead or dwelling | 843 | | |
| 4. | Waste, unoccupied dwellings, buildings and structures, roads, ditches, etc. | | | |
| 5. | Woodland | 831 | 831 | 831 |
| 6. | Pasture | Permanent (not in crop rotation) | 842 | 842 |
| | | | 856 | 856 |

Estimation Components:
 Area Sampling Frame+
 June Area Segment+
 Questionnaire

Regression-based Acreage Estimator

Acreage not just about counting pixels

The Goal: Identify areas with defined acreage totals to compare CDL pixel counts
Current Solution: June Agriculture Survey Segments

June Ag Segment 

Farmers within
segment
report 220 acres of
corn

Vs

.

Crop Land Data Layer

Pixel Counting 
estimates 180 acres of
corn

Regression-based Acreage Estimator

Acreage not just about counting pixels

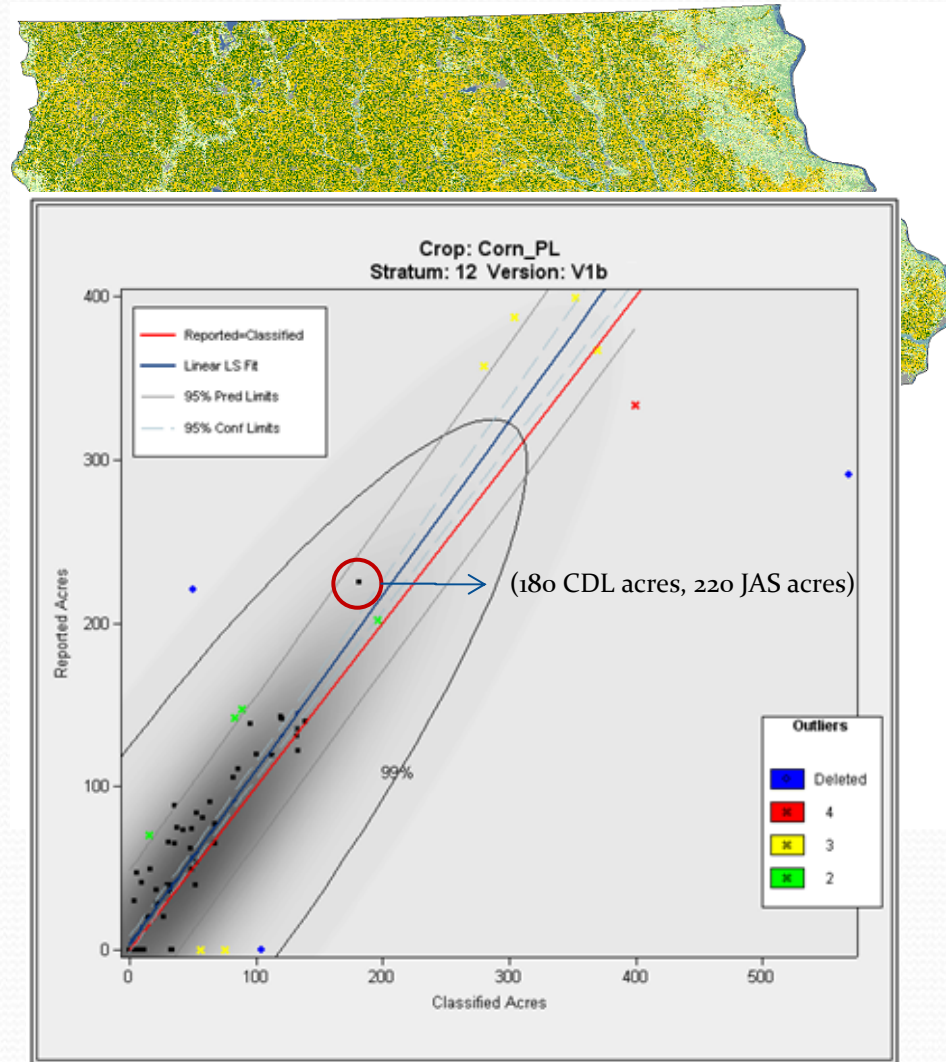

Simple Linear Regression

Regression used to relate categorized pixel counts to the ground reference data

- **(X) – Cropland Data Layer (CDL) classified acres**
- **(Y) – June Agricultural Survey (JAS) reported acres**

Outlier segment detection - removal from regression analysis

Using regression results in estimates reduces error rates over using JAS alone

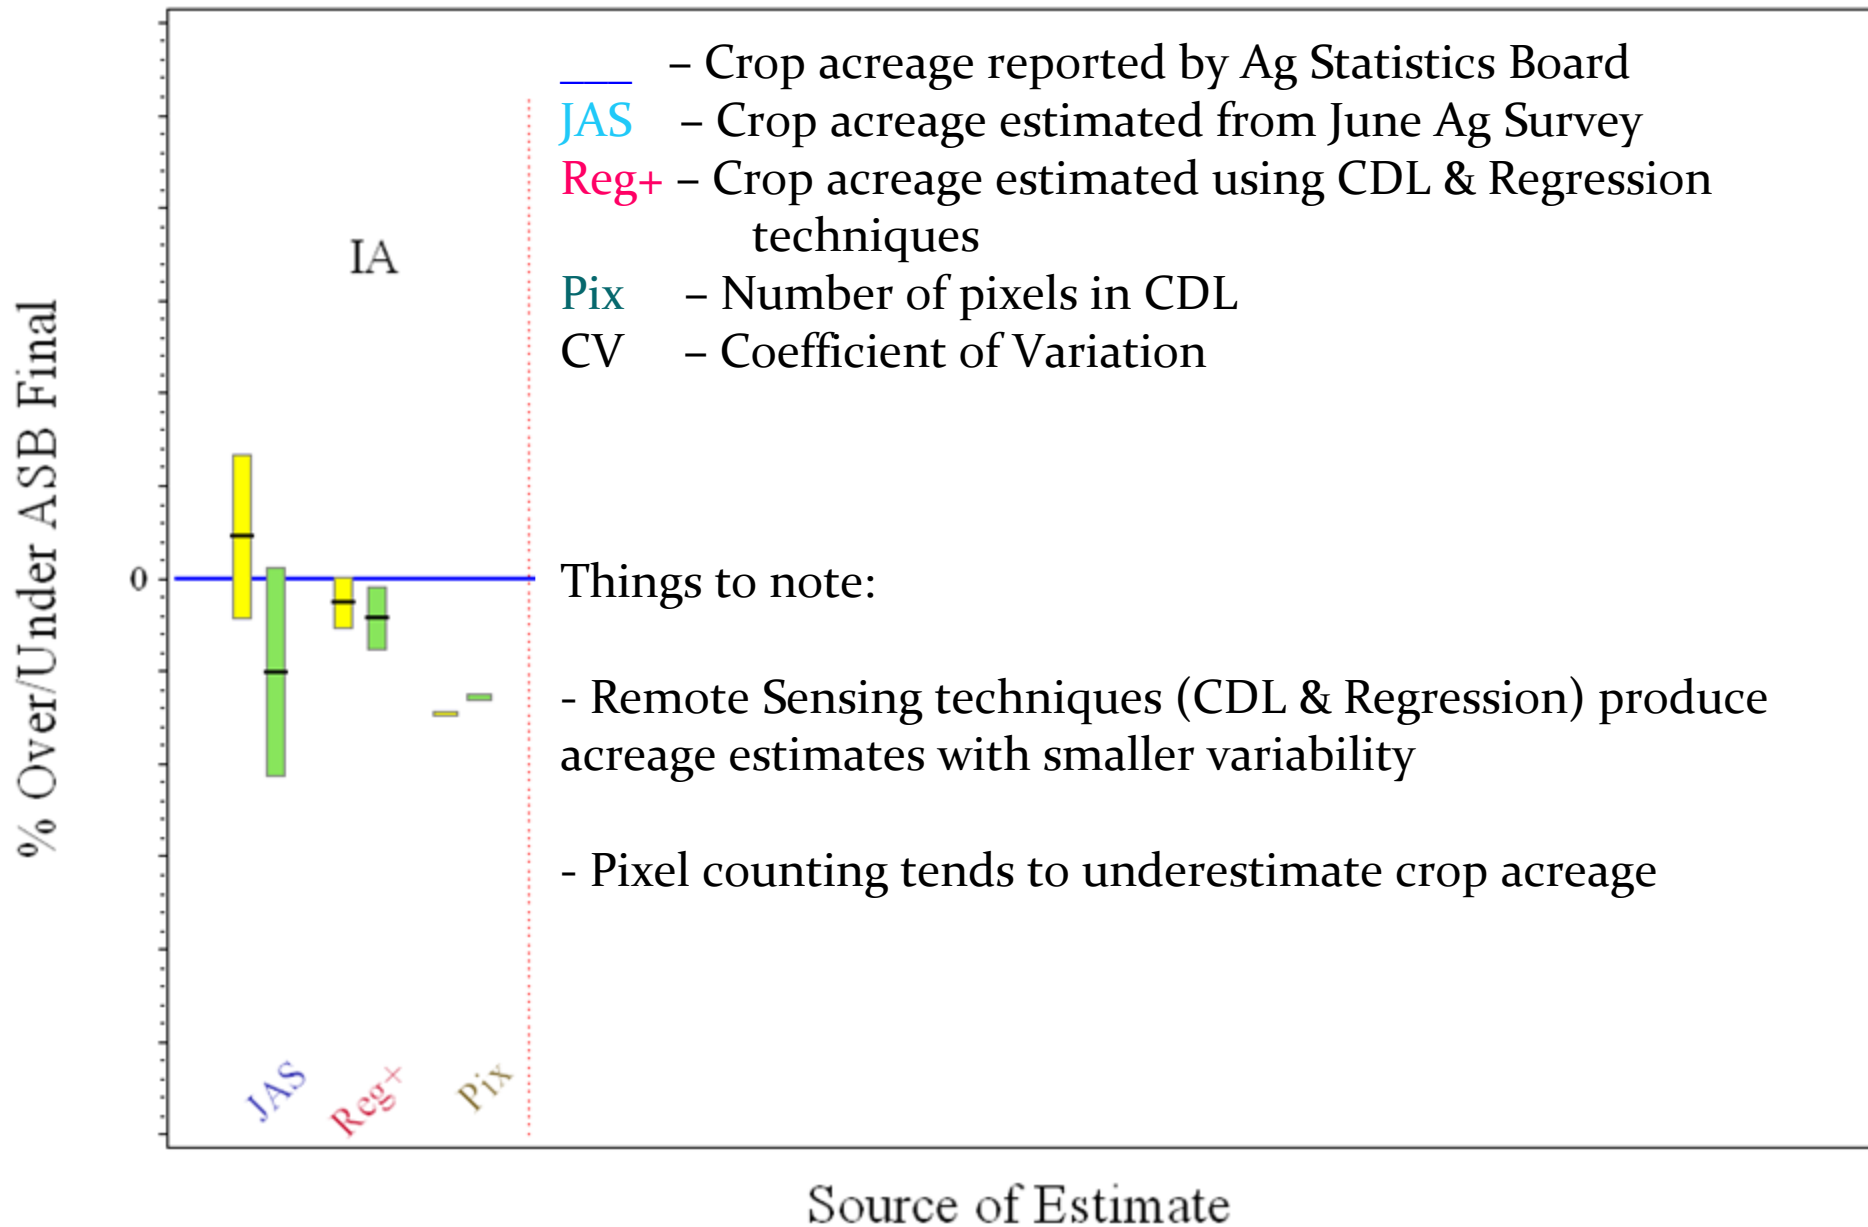

2008 State Level Estimates +/- 2 CVs

| Post Season County Level Estimates | 15 | 19 | 36 | 36 |
| Crops | 9 | 14 | 15 | 16 |

Geospatial Decision Support Systems

Doraiswamy Remote Sensing Yield Program

- Operational in 7 major corn & soybean states.
- Tech transfer from USDA/ARS complete
- MODIS sensors used, 8 day +7 day eMODIS; data are smoothed
- Cropland Data Layer platform for masks
- Operational processing – 2 week prototype development reduced to 2 days
- Current issues include:
 - August predictions unlikely with current methodology.
 - Sept. R^2 's ~ 0.850 /state for corn
 - Oct. R^2 's ~ 0.93 for corn; 0.810 for soybeans
 - NDVI a reliable predictor for corn yields; soybeans need NDVI/EVI + other variable(s)

Geospatial Decision Support Systems

Design of Remote Sensing-Based U.S. National Crop Progress Monitoring System (NCPMS)

Zhengwei Yang^{1,2}, Liping Di², Genong Yu², Rick Mueller¹

¹Research and Development Division, USDA NASS

²Center for Spatial Information System Science

George Mason University

Zhengwei_yang@nass.usda.gov

NASS

FACT FINDERS FOR AGRICULTURE
UNITED STATES DEPARTMENT OF AGRICULTURE

Project Goals

- To support and enhance the operation of monitoring nationwide crop progress and conditions at NASS
 - Develop science based crop progress metrics
 - Develop and prototype an operational National Crop Progress Monitoring System (NCPMS)
- Develop NCPMS products that will be complementary to existing NASS Crop Progress products
- To enhance the NASS crop progress and condition data accessibility, interoperability and dissemination

Why does NASS need a Remote Sensing-Based Crop Progress Monitoring System?

- NASS currently conducts weekly, volunteer-based crop progress surveys, and publishes crop progress and condition reports.
- The current crop progress monitoring is
 - point-based sampling
 - subjectively estimated
 - lacks spatial distribution information
 - Inconsistent results
- Remote sensing technology provides:
 - Objective, consistent, science -based, geospatially covered, time series observations.

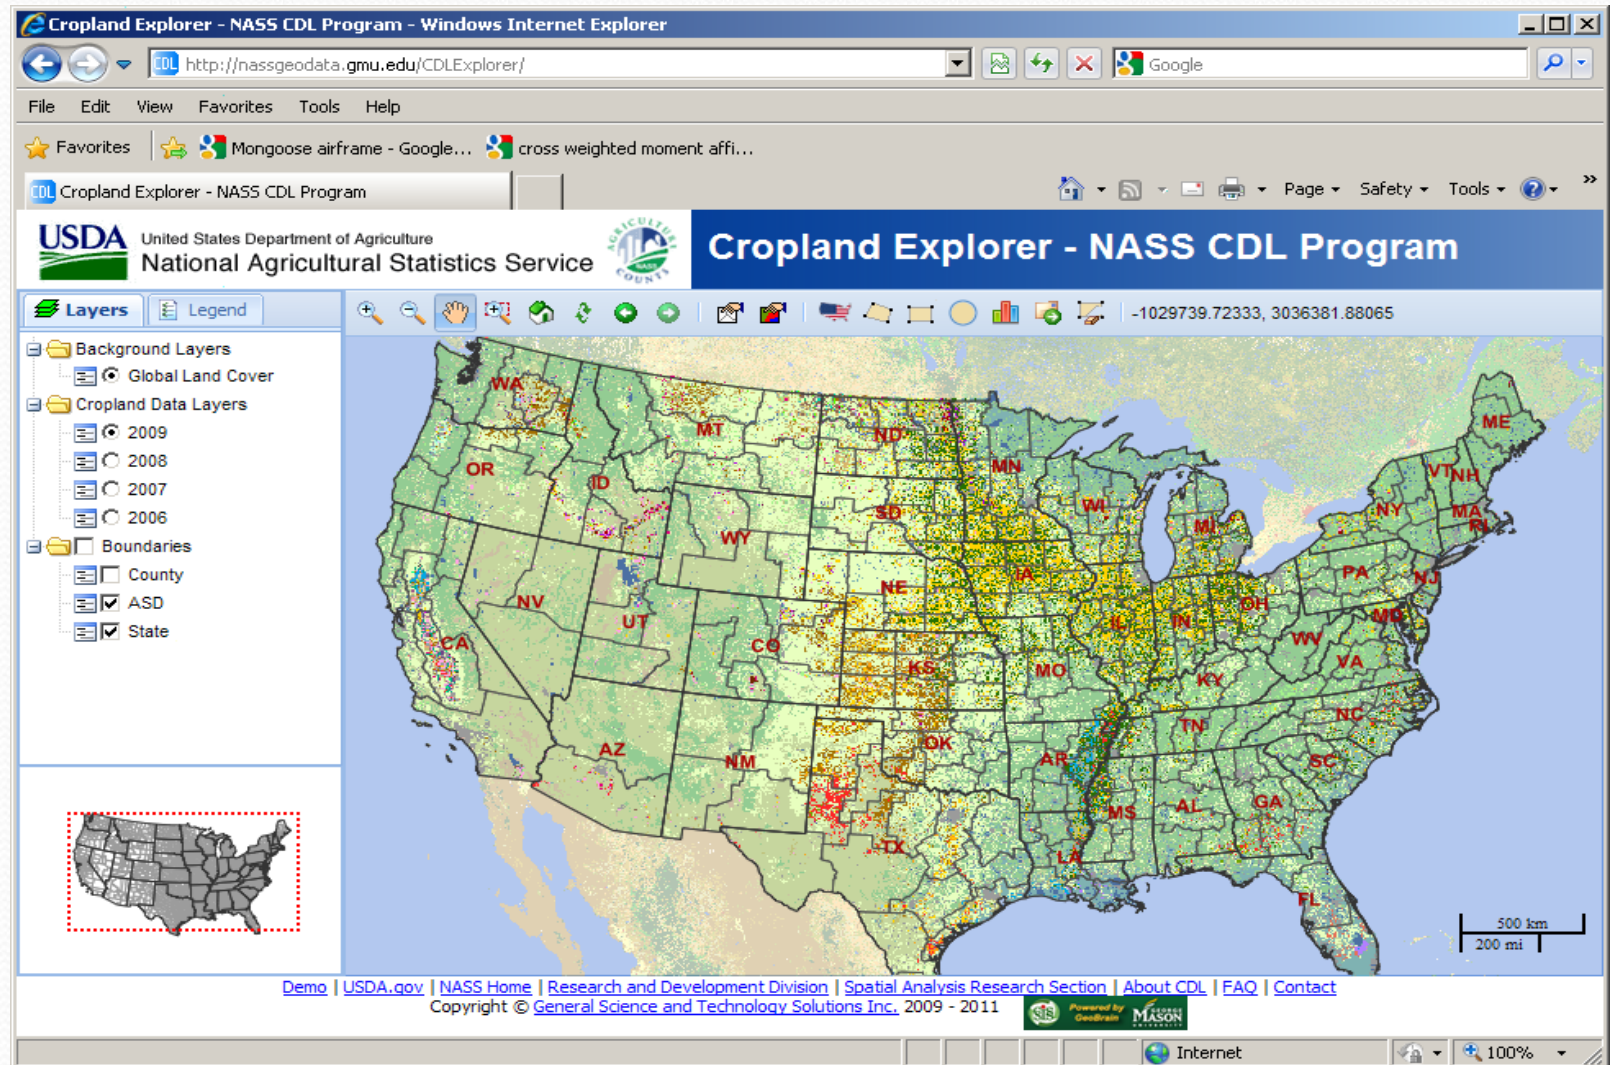

Major System User Requirements

- Minimum reporting area enforced to guarantee privacy.
- Interactive crop progress map generated.
- Pixel-level or field level granularity
- On-the-fly presentation within user defined region.
- Geospatial query capability.
- Crop specific phenological information.
- Equal access and dissemination via spatially enabled Web-based systems.

Design Principles of Operational NCPMS

- The system should be able to assimilate and prepare Earth Observing data for use in agricultural crop growth monitoring and accuracy improving.
- The system should be capable of efficiently (timely) applying Earth Observing research results and data in crop growth development estimation.
- Advanced data mining algorithms and crop models should be implemented and can be plugged-in to readily take advantage of resources available in the system.
- Systematic approaches should be applied to
 - integrate data, services (Web computer software programs)
 - disseminate results through the Web
 - operate the national crop progress monitoring system in a standard-compliant virtual Web environment.

Data Dissemination & Visualization Example – Cropland Explorer

Remote Sensing-based Budget Initiative

Providing Foundational Data Needs for Monitoring and Assessment of the Effects of Climate Change on U.S. Agriculture

Geospatial Information Branch - Spatial Analysis Research Section (SARS),
Fairfax, VA

Areas of Work-NASS & WAOB

- Expansion & Improvements of Existing Efforts
 - Cropland Data Layers and Acreage Estimation
 - Yield Estimation for state and county levels
- New Research & Development Areas
 - Crop Progress, Crop Condition, Soil Moisture, Disaster Monitoring and Assessments
- Create Digital GeoArchive
- Delivery of Products via Internet

New Research Areas

- **Crop Progress** – Provide quantitative assessments by stage of crop for each specific crop.
- **Crop Conditions** – Quantitatively assess the amount of a specific crop in very poor, poor, fair, good, and excellent condition.
- **Soil Moisture** - Monitoring and assessing Topsoil (surface to 6" depth) and Subsoil (>6"-- 3-4') moisture in categories similar to the following
- Very short, Short, Adequate, Surplus.
- **Natural Disaster Monitoring & Assessment** - timely monitoring & assessing significant events affecting crop area, conditions and yield

Official USDA Publications Impacted by the Initiative

Crop Progress

Released June 29, 2009, by the National Agricultural Statistics Service (NASS), Agricultural Statistics Board, U.S. Department of Agriculture. For information on *Crop Progress* call Julie Schmidt at (202) 720-7621, office hours 7:30 a.m. to 4:00 p.m. ET.

Iowa Crops & Weather

USDA – National Agricultural Statistical Service – Iowa Field Office
 In Cooperation with the Iowa Department of Agriculture and Land Stewardship
 210 Walnut, Room 833 • Des Moines, Iowa 50309-2195
 515-284-4340 • 1-800-772-0825 • FAX 515-284-4342 • nass-ia@nass.usda.gov
 To access NASS reports – <http://www.nass.usda.gov>

Issued June 29, 2009

Vol 09-17 For the week ending June 28, 2009

Weekly Weather and Crop Bulletin

Released September 1, 2009, by the National Agricultural Statistics Service (NASS), Agricultural Statistics Board, U.S. Department of Agriculture. For information on *Weekly Weather and Crop Bulletin* call Julie Schmidt at (202) 720-7621, office hours 7:30 a.m. to 4:00 p.m. ET.

Volume 97, No. 9 <http://www.usda.gov/oce/weather> March 2, 2010

Natural Disaster Assessments - Prototype Crop Yield Map

Raw AWiFS

Yield Impact

Major Issues Facing Our Program

NEAR TERM

- Sensors, sensors, sensors!
 - Without Landsat TM, 2010 would have been a huge setback for remote sensing in NASS!
 - AWiFS solar panel partial failure
 - Future Use & Access to SPOT VEG unsure
 - Resourcesat 2 launch, and priority for U.S. acquisitions?
- Flow of imagery must be uninterrupted during growing season

LONG TERM

- MRLI support to U.S. civilian agencies unclear.
- MODIS replacement (VIRS) a downgrade
- Operational needs have evolved beyond current strategies to support them.
- NASS will encourage USDA move to push for higher priority launch of HypsIRI sensor.

HyspIRI Thermal Infrared Multispectral (TIR) Science Measurements

Multispectral Scanner

Schedule: 4 year phase A-D, 3 years operations

High Heritage

Measurement:

- 7 bands between 7.5-12 μm and 1 band at 4 μm
- 60 m resolution, 5 days revisit
- Global land and shallow water

Science Questions:

- TQ1. Volcanoes/Earthquakes (MA,FF)
 - How can we help predict and mitigate earthquake and volcanic hazards through detection of transient thermal phenomena?
- TQ2. Wildfires (LG,DR)
 - What is the impact of global biomass burning on the terrestrial biosphere and atmosphere, and how is this impact changing over time?
- TQ3. Water Use and Availability, (MA,RA)
 - How is consumptive use of global freshwater supplies responding to changes in climate and demand, and what are the implications for sustainable management of water resources?
- TQ4. Urbanization/Human Health, (DQ,GG)
 - How does urbanization affect the local, regional and global environment? Can we characterize this effect to help mitigate its impact on human health and welfare?
- TQ5. Earth surface composition and change, (AP,JC)
 - What is the composition and temperature of the exposed surface of the Earth? How do these factors change over time and affect land use and habitability?

HyspIRI compared with possible International Imaging Spectroscopy Missions

Only HyspIRI provides the full spectrum of data required to address climate-carbon cycle feedbacks articulated in the NRC Decadal Survey

HyspIRI Provides Seasonal and Annual Global Coverage that Uniquely Addresses Critical Gaps in Climate Research and Ecosystem Understanding.

>100 years for international mission to equal 1 year of HyspIRI

| Country | Instrument | Swath km | Pixel Size, m | Terrestrial Coverage in 19 days | Repeat interval, days | TIR capability |
|---------|--------------------|----------|---------------|---------------------------------|-----------------------|----------------|
| USA | HyspIRI | 150 | 60 | 100% | 19 | 8 TIR bands |
| Germany | EnMAP | 30 | 30 | <1% | — | NO |
| Italy | PRISMA | 30-60 | 20-30 | <1% | — | NO |
| Japan? | ALOS3 | 30 | 30 | <1% | — | NO |
| India? | IMS Resource Sat-3 | 25 | 25 | <1% | — | 1 TIR band |

US, HyspIRI: a full spectral range (380 to 2500 at 10 nm), high SNR, uniform, 60m spatial with 150 km swath imaging spectrometer and multiband thermal imager (8 band thermal imager from 3-12 μm).

Other countries are occasionally mentioned (China, South Africa, South Korea, etc.). All are proposing first generation small sample process/application missions with scattered terrestrial coverage and no TIR imager

Key Features of NASA HypsIRI

- 1) Hyperspectral: Visible ShortWave InfraRed (VSWIR) Imaging Spectrometer - Full spectrum 380 to 2500 nm, 60 m resolution, with 150 km swath, repeat coverage 19 days
- 2) Multispectral Thermal InfraRed (TIR) Scanner - 7 bands between 7.5-12 μm and 1 band at 4 μm , 60 m resolution, with 600 km swath, repeat coverage 5 days
- Potential for climate/water/carbon/land use monitoring/wildfires/droughts
