The Cropland Data Layer Project Status

Oklahoma and Washington Were Added for 2006

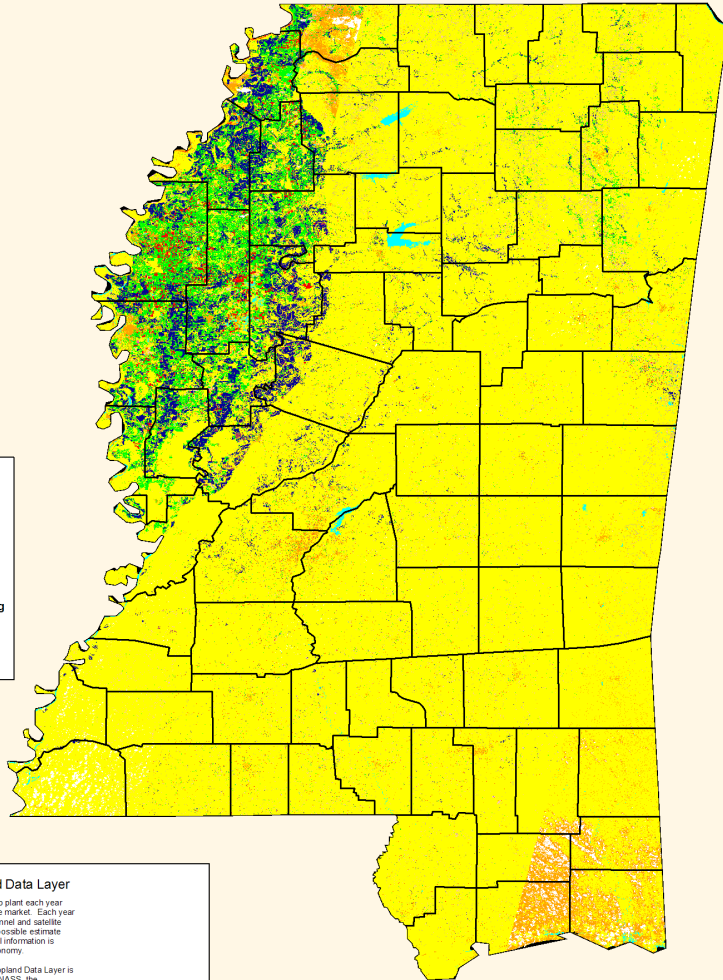

The Cropland Data Layer in Mississippi

- Multi-temporal processing based on USDA-NASS programs started in the 1970s and the LARSYS software from Purdue University.
- Mississippi project started in 1999 using the Public Domain Peditor and RSP software programs of NASS.
- A cooperative project of NASS, Mississippi State University, and the Mississippi Department of Agriculture and Commerce.

Mississippi Cropland Data Layer

Mississippi farmers select crops to plant each year depending on the weather and the market. Each year the USDA-NASS uses field personnel and satellite imaging to help provide the best possible estimate of crop production. This statistical information is important in predicting the US economy.

Compilation of the Mississippi Cropland Data Layer is a cooperative effort of the USDA-NASS, the Mississippi Department of Agriculture and Commerce, and the Mississippi State University Cooperative Extension Program.

Landsat imagery was processed and enhanced for this map. The official result is available on disk from USDA-NASS at (800) 727-9540.

Mississippi farmers select crops to plant each year depending on the weather and the market. Each year the USDA-NASS uses field personnel and satellite imaging to help provide the best possible estimate of crop production. This statistical information is important in predicting the US economy.

Compilation of the Mississippi Cropland Data Layer is a cooperative effort of the USDA-NASS, the Mississippi Department of Agriculture and Commerce, and the Mississippi State University Cooperative Extension Program.

Landsat imagery was processed and enhanced for this map. The official result is available on disk from USDA-NASS at (800) 727-9540.

Forests by Type

The Mississippi Institute for Forest Inventory assesses forests in Mississippi with field inventory procedures. These assessments are designed from periodic acquisitions of satellite imagery from the Landsat program. This map of forests shows the distribution of forest types based upon their composition. The three forest types depicted are pure hardwood, pure pine, and a mixture of pine and hardwood. Also, included within the classification are areas of non-forest and bodies of water.

Mississippi Major Crop Planted Acres Estimates, 1999-2005 Cropland Data Layer Value as Percent of the Official Estimate

Multiyear Overlays Cotton

The variation of land use for cotton in the Delta over a 7 year period is shown in this map.

The darker the shade of blue, the more years the same land was used to grow cotton.

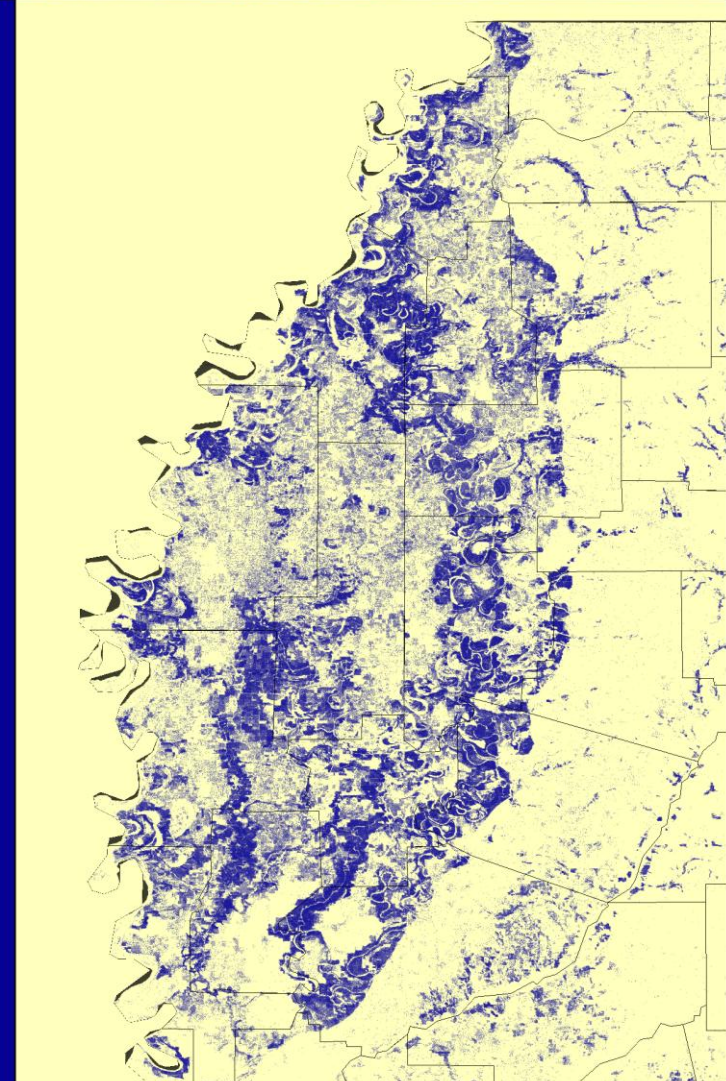

Frequency of Acreage Planted to Cotton, 1999-2005

In the crescent moon-shaped part of northwestern Mississippi known as The Delta, cotton is usually planted in sandy soil along existing or ancient rivers and creeks.

Cotton crop rotations are used but high cotton prices can lead to the same land being used for cotton every year.

Map shows satellite cotton classification range from the Cropland Data Layer by Dr. Fred Shore.

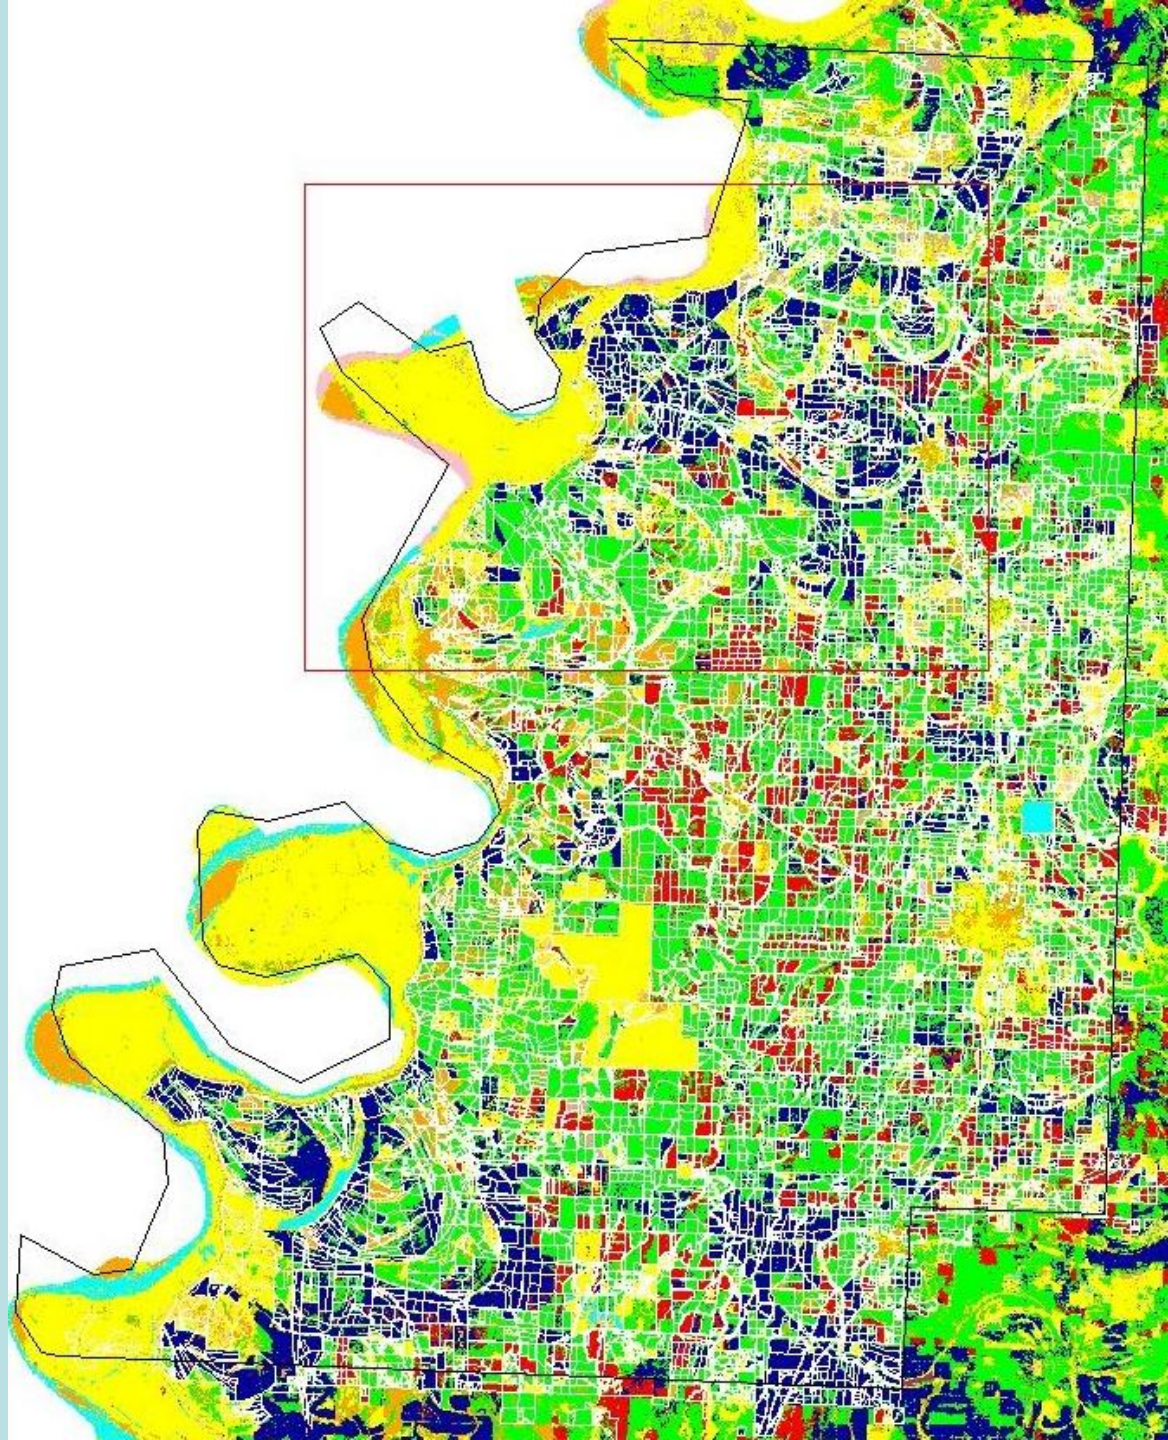

Multiyear Data from the Mississippi Cropland Data Layer Classifications

Methods

- **RSP/Peditor, the USDA-NASS public domain software, is used to produce acreage estimates and classified images for the Cropland Data Layer program.**
- **ENVI 4.2/IDL® is used to capture field-level classification data.**
- **SAS ® is used to convert the ENVI output to a database and run queries on the data.**

Remote Sensing Cotton Estimation Comparison, Peditor and Field Database

Multiyear Data from the Mississippi Cropland Data Layer Classifications

Results

- A field database of pixel count extractions of the Cropland Data Layer per year for 7 years was obtained.
- For Bolivar County, 1999-2005:
 - The frequency of single year land use for cotton was greatest in 2001 (56.06% of the fields with >50% cotton). This unusual planting of cotton coincides with the 1996 Farm Bill ending in 2001.
 - About 16% of the cotton acres per year are from the same fields.
 - A total of about twice the acres of the annual acreage estimate has cotton history.
 - Cotton acreage estimates per year from the database agree well with previous estimates.

Multiyear Data from the Mississippi Cropland Data Layer Classifications

Discussion

- This conversion of the spatial remote sensing classified values per field allows examination of multiyear data and reveals single year exceptions and multiyear trends that were not available through the traditional single year result .
- The published Cropland Data Layers for Mississippi and other states can be obtained from USDA-NASS by calling (800) 727-9540 and on-line from www.mdac.state.ms.us and from <http://www.nass.usda.gov/research/Cropland/SARS1a.htm>.

Acknowledgements

Commissioner Lester Spell, Jr., D.V.M., Mississippi Department of Agriculture and Commerce, Dr. Vance H. Watson, Interim Director, Mississippi Cooperative Extension Service, and the USDA Field Enumerators in Mississippi were critical to the success of this project. Also, thank you to Andy Pursch of ITT for IDL programs and ENVI training.
