# 2006 California Almond Objective Measurement Report

Released: July 6, 2006 12:00 p.m. PDT

USDA, National Agricultural Statistics Service, California Field Office

#### 2006 CALIFORNIA ALMOND FORECAST

California's 2006 almond production is forecast at 1,050 million meat pounds, up 3 percent from May's subjective forecast and 15 percent above last year's crop. The forecast is based on 580 thousand bearing acres. Production for the Nonpareil variety is forecast at 378 million meat pounds, 34 percent above last year's deliveries. The Nonpareil variety represents 36 percent of California's total almond production.

Despite several factors that could have led to a lighter set, the 2006 California almond set appears spotty, but strong overall. Some of the factors contributing to the inconsistency of the set include a low accumulation of chilling hours that resulted in an early bloom, a frost that hit some early varieties, minor hail damage, and wet, cool conditions that continued throughout the spring. Damage from the leaf-footed bug varied, but should not affect overall production significantly. The popular Nonpareil variety shows a strong set, as do the Butte and Padre varieties. Kernel weight, length, width, and thickness are all down from last year.

The average nut set per tree is 6,723, up 23 percent from 2005. The Nonpareil average nut set of 6,848 represents a 47 percent increase from last year's set. The average kernel weight for all varieties sampled was 1.57 grams, 12 percent below last year. A total 97.4 percent of all nuts sized were sound.

#### **SAMPLING PROCEDURES**

To determine tree set, nuts are counted along a path within a randomly selected tree. Work begins at the trunk and progresses to the end of the terminal branch. Using a random number table, one branch is selected at each forking to continue the path. A branch's probability of selection

is directly proportional to its cross-sectional area. This methodology is used because of its statistical efficiency. The method also makes it possible to end up at any one of the tree's numerous terminal branches.

Since the selected path has a probability of selection associated with it, this probability is used to expand nut counts arriving at an estimated set for the entire tree.

Along intermediate stages (i.e., the bearing surface between forkings), every fifth nut is picked. All nuts on the terminal branch are picked. These nuts are used to determine size and weight measurements.

#### FIELD SAMPLING ACTIVITIES

The survey began May 31 and sampling was completed by June 23. There were 1,668 trees sampled for the 2006 survey in 834 orchards. An additional 113 orchards were not sampled for one of the following reasons:

- 1) Orchard had been sprayed.
- 2) Orchard had been recently irrigated and was wet.
- 3) Orchard had been pulled.
- 4) Owner refused to cooperate or could not be contacted.

The Objective Measurement Survey is funded by the Almond Board of California, in cooperation with the California Department of Food and Agriculture.

#### **DATA RELIABILITY**

The 80 percent confidence interval is from 971 million meat pounds to 1,129 million meat pounds. This means that the results of our sampling procedures will encompass the true mean 80 percent of the time.

- 1/ Butte and Padre variety breakdowns were initiated in 2002.
- 2/ For survey purposes, the California classification includes the following varieties: Aldrich, Ballico, Carmel, Davey, Fritz, Harvey, Le Grand, Mono, Monterey, Norman, Price Cluster, Ruby, Tokoyo and Yosemite.
- 3/ Carmel variety is also included in California Types.

Sacramento Valley includes these counties: Butte, Colusa, Glenn, Solano, Sutter, Tehama, Yolo and Yuba. San Joaquin Valley includes these counties: Fresno, Kern, Kings, Madera, Merced, San Joaquin, Stanislaus and Tulare.

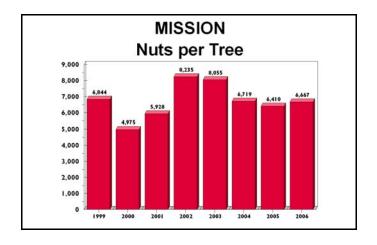

Butte and Padre variety breakdowns were initiated in 2002.
For survey purposes, the California classification includes the following varieties: Aldrich, Ballico, Carmel, Davey, Fritz, Harvey, Le Grand, Mono, Monterey, Norman, Price Cluster, Ruby, Tokoyo and Yosemite. Carmel variety is also included in California Types.
